A **FREE** MODEL
KIT FOR
SLAGTOWN

The **Slagtown** series of constructions sets and kits are designed for 28mm science fiction skirmish games in future cities where blight has overcome promise. The free model is to get you started. The textures on the girders and platforms are from **Slagtown:Eden**, so that your model will blend in. The tower design is somewhat simpler than in the full **Slagtown: Eden** set. That way you can build an extensive series of abandoned, half-finished buildings quickly. The parapet and crates are from **Slagtown:Salvage**, but the textures are entirely new. (When I get a free sample, I don't want it to be a complete duplicate of something I'm going to buy.)

INSTRUCTIONS

THE TOWER:

1. Score then cut the struts. Fold and glue into square tubes. Fold end tabs inside leaving them sloped slightly upward.
2. Cut the 3x3 base. For extra strength and sturdiness, laminate a 3x3 inch square of cardstock to the underside. Glue a strut in each corner.
3. Score and cut out the platform. Fold side supports down and glue the tabs. If additional strength is desired, laminate one or two pieces of 3x3 cardstock to the underneath side of the base.
4. Glue the platform to the tops of the four struts, being careful to orient the ladder side of the one strut so that it faces outward.

THE WALKWAY:

5. Cut out the walkway and score along the side supports. Bend the side supports down at a 90 degree angle.

THE PARAPETS:

6. Score, cut, fold and glue each parapet side. The slimy rusted green tabs fold outward. Glue slimy tabs to the platform floor, so the wire harness forms an overhang (it stiffens the sides and the platform).
7. Score, cut, and fold a corner for each corner you created, then glue in place.
8. Alternatively, glue the four parapet sides together to form a square, using the platform as a size mold. Then you can slip the walls on or off.

THE CRATE AND HAZMAT CONTAINER:

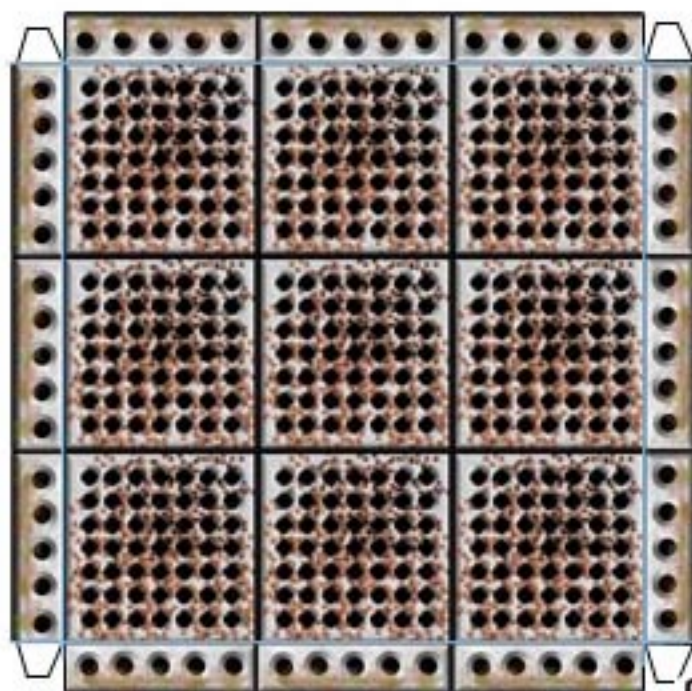

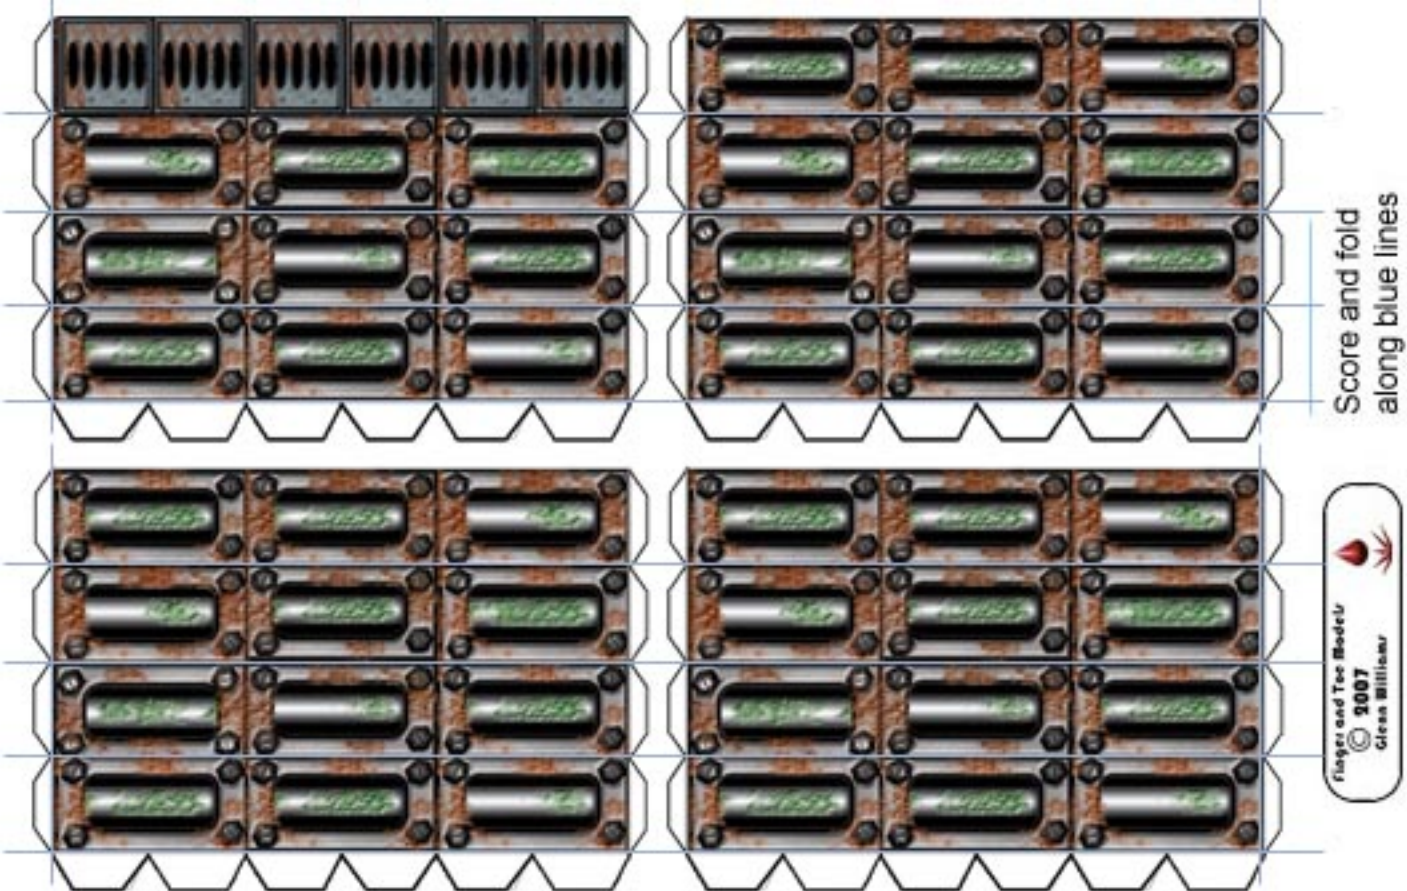

9. Score, cut, and fold the crates into a cube and the hazmat containers into a hex crossed shaped "tube." Glue.

SUGGESTIONS:

10. Stack two or three tower modules, then add the rampart to the top one (as in the cover photo).
11. Glue a parapet section to the struts to create protected lower levels for your tower.
12. Cut out parapet sections to allow walkways to be placed (see the cover photo).
13. The Slagtown series was designed for gamers, but especially for those who just can't build a model without tweaking, changing . . . making it their own, the kit-bashers. Open your favorite image processor, experiment. Have fun.

IF YOU LIVED HERE, YOU'D BE DEAD NOW!
